Interface between psychiatric diseases and FTD

This presentation will review the complexities of differentiating primary psychiatric disorders from frontotemporal dementia in the clinical context. We will discuss recent developments in diagnostic approaches and biomarkers for FTD, and how those can be integrated in clinical practice. Topics will include psychiatric prodromes in genetic FTD, bvFTD phenocopies, strengths and limitations of brain imaging methods, the recommendations for genetic testing and the role of potential new biomarkers such as Neurofilament Light Chains.
